ADH TEST 1

Question 2.

Code: The developers make changes.

Commit: The developers commit the changes to the repository.

Related Code: Stores the code related to what developers are making changes to or the code the developers are working on.

Build: This is where the source code from the repository is integrated.

Unit tests: Each unit/component is tested separately to ensure that it does work.

Integration Tests: The functionalities of multiple components are tested together.

Review: Validate the quality, functionality and other vital features and components of the software. This is done to ensure that it meets requirements defined by the client.

Staging: This is QA environment, where the code is integrated and tested before goes to Production environment.

Production: the built version is delivered to production and be available for use.
